ABOUT OUR HIGH-LEVEL VACUUMING SERVICES

Kingfisher Industrial Services is one of the only companies in the UK that offer high-powered industrial vacuum services for **hard-to-reach areas and furnace zones which are susceptible to build ups of oil, dust, tar and grime.**

We have found that **high-level areas of client's factories often get overlooked** when it comes to cleaning. However, if these areas are ignored then it could have **expensive and dangerous consequences.**

We have built a reputation as a leading specialist industrial cleaning company which develops and innovates bespoke solutions to best suit our customers' requirements. We use the highest quality powered vacuumed systems with relevant attachments and pipes to access hard-to-reach areas.

THE PROBLEMS

FIRE

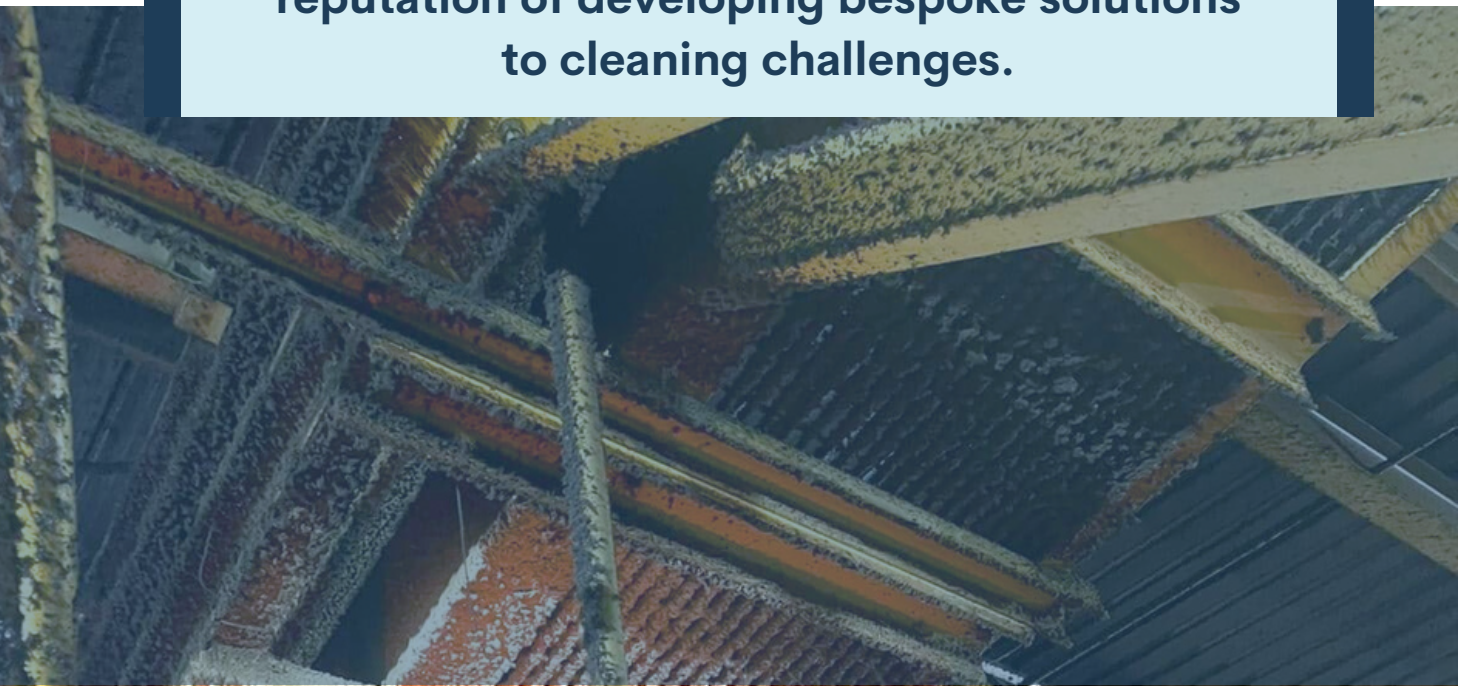

Without a doubt, **the biggest risk of high-level oil and dust build up is fire.** Clients can implement as many fire safety and prevention measures as they like, but if high-temperature machinery is operating near **oily roofs, pipes and girders, then fires can spread quickly.** Before we began offering this service, we saw many fires at our clients' sites being caused by **years of oil, dust and tar build up** around the furnace areas.

CONTAMINATION OF PRODUCTS

Again, before we began offering this service, **gantry areas and machinery immediately around production was covered in inches of dust, tar and oil.** This was in constant danger of **falling down** onto their products and causing **cross-contamination.**

Faced with these problems, our clients' approached us directly owing to our reputation of developing bespoke solutions to cleaning challenges.

THE PROCESS OF YOUR VACUUM CLEAN

Kingfisher cleaning projects are fully managed from the first phone call.

We arrive to site having received **permits and approvals of our RAMS** by the client's relevant on-site manager.

All of our industrial vacuum units are owned by the company which gives **ultimate flexibility and cost-savings** when booking your project.

Specialist and flame retardant PPE is used so that our operatives can work safely in extreme temperatures when working around furnace areas.

A critical aspect of our work is that **we do not let any dust, oil or contaminants drop down to lower levels**, which can often be directly above working manufacturing machinery and production lines.

Call today for your free, no obligation site survey.
